

PROTECT THE AIR YOU BREATHE!

In some homes, indoor comfort comes with side effects. Many people find that when they use their central air conditioning or heating systems, allergies, headaches and cold symptoms seem to worsen. Unfortunately, air conditioning coils are dark and damp, offering the perfect environment for the growth of harmful bacteria, fungi and molds. So in establishing a comfortable temperature, homeowners can unwittingly create unhealthy air.

Comfort Plus UV Light Systems are a remarkably effective means of arresting this bacterial growth. The unit emits a germicidal ultraviolet frequency that penetrates the cell walls of detrimental microbes, permanently neutralizing any ill effects. And better health isn't the sole benefit. When mold or similar microbes have been reduced, the heating and air condition system efficiency often improves, saving you money on operating costs.

The UV-100 single lamp unit emits Ultraviolet light at 253.7 nanometers - the optimum light frequency in combating the bacteria that commonly infest air conditioners. Placed directly above the unit's coils, the UV-100 halts existing growth and prevents recurrence. Germicidal UV-C applied to your central air system is a safe, economical, chemical-free way to significantly reduce airborne contaminants

You and your family will breathe easier knowing that the Comfort Plus Germicidal UV Light System is working to protect the air in your home.
